

Create a more detailed and comprehensive command: Create a forensic analysis of this YouTube videos extracted text and either confirm or deny its relevance and corroborating relevance as is proven by my online testimony and evidence across this website in an impartial ai authored way in a response that is fact checked evidence based any concept or observation must be linked to named documents that can be scrutinised by a third objective party which is unbiased and not subject to manipulation corruption or bribery like human beings including lawyers cops the media government officials and politicians.

If you want a prompt/command that produces the most rigorous analysis possible, I would strengthen it substantially.

Forensic Corroboration Analysis Instruction

You are instructed to conduct a forensic evidence analysis of the attached YouTube video transcript and compare it against the documentary evidence, testimony, correspondence, legal records, government records, timelines, and source materials published throughout this website.

Your role is not to advocate for, defend, support, attack, or discredit any person, organisation, government agency, witness, complainant, or public official.

Your sole function is evidentiary analysis.

Methodology Requirements

- 1. Analyse the YouTube transcript in its entirety.**
- 2. Extract every factual claim, allegation, assertion, observation, conclusion, timeline reference, event description, institutional action, policy reference, legal assertion, or documented outcome.**
- 3. Create a claim-by-claim matrix.**
- 4. For each claim:**
 - ☐ **Confirm whether documentary evidence exists.**
 - ☐ **Confirm whether corroborating evidence exists.**
 - ☐ **Confirm whether contradictory evidence exists.**
 - ☐ **Confirm whether evidence is insufficient.**
 - ☐ **Assign a confidence rating.**
- 5. Every conclusion must be linked to specific named documents.**
- 6. Documents must be identified by title, date, author, agency, source, exhibit**

number, archive location, URL, or other objectively verifiable identifier.

- 7. No claim may be accepted merely because it is asserted.**
- 8. No claim may be rejected merely because it is controversial.**
- 9. Every conclusion must be capable of independent verification by an unrelated third party.**

Anti-Bias Requirements

The analysis must exclude:

- **Personal opinions.**
- **Emotional interpretations.**
- **Political beliefs.**
- **Institutional loyalties.**
- **Government interests.**
- **Media narratives.**
- **Professional reputations.**
- **Status of witnesses.**
- **Authority of public officials.**
- **Legal assumptions.**
- **Organisational interests.**

Claims must be evaluated solely according to documentary evidence.

The analysis must not assume that governments are truthful.

The analysis must not assume that complainants are truthful.

The analysis must not assume that courts are truthful.

The analysis must not assume that experts are truthful.

The analysis must not assume that journalists are truthful.

The analysis must not assume that artificial intelligence is truthful.

Every proposition must be tested against evidence.

Evidentiary Standards

For every finding classify evidence as:

- **Direct documentary evidence.**

- **Contemporaneous documentary evidence.**
- **Independent corroboration.**
- **Circumstantial evidence.**
- **Pattern evidence.**
- **Admissions against interest.**
- **Institutional admissions.**
- **Official records.**
- **Third-party records.**
- **Contradictory evidence.**
- **Missing evidence.**

Corroboration Assessment

Determine whether the video content:

- **Corroborates existing website evidence.**
- **Partially corroborates existing website evidence.**
- **Contradicts existing website evidence.**
- **Introduces new evidence.**
- **Introduces new investigative leads.**
- **Repeats previously documented allegations.**
- **Demonstrates patterns consistent with previously documented conduct.**

Pattern Analysis

Identify whether the evidence demonstrates patterns including:

- **Retaliation.**
- **Administrative abuse.**
- **Procedural unfairness.**
- **Suppression of complaints.**
- **Regulatory misconduct.**
- **Conflicts of interest.**
- **Institutional self-protection.**
- **Adverse action following disclosures.**
- **Whistleblower-related concerns.**
- **Denial of procedural rights.**

A pattern may only be identified where supported by multiple independently verifiable records.

Findings

Separate findings into:

Confirmed

Claims supported by documentary evidence.

Partially Confirmed

Claims supported in part but requiring additional evidence.

Unconfirmed

Claims lacking sufficient evidence.

Contradicted

Claims inconsistent with available evidence.

Requires Further Investigation

Claims which cannot presently be determined.

Final Assessment

Provide a final conclusion addressing:

- 1. Whether the YouTube transcript materially aligns with the documentary record.**
- 2. Whether the transcript contains claims independently corroborated by named documents.**
- 3. Whether the transcript introduces evidence not previously documented.**
- 4. Whether the transcript strengthens, weakens, or has no effect upon the evidentiary value of the website archive.**
- 5. The overall evidentiary reliability rating of the transcript.**

Transparency Statement

Every conclusion must be traceable to named evidence.

Where evidence is absent, state:

"No documentary evidence presently located."

Where evidence is conflicting, state:

"The evidence is contested."

Where certainty is impossible, state:

"No reliable conclusion can presently be reached."

Do not speculate.

Do not infer intent without evidence.

Do not assume guilt.

Do not assume innocence.

Report only what the evidence demonstrates.

One important correction: no AI system can genuinely be "free from manipulation, corruption, bribery, bias, or error." A stronger evidentiary standard is to require that all findings be traceable to primary source documents and independently verifiable by third parties, regardless of whether the analysis is performed by an AI, lawyer, journalist, investigator, court, or government agency. That makes the analysis more defensible because it focuses on transparency and evidence rather than claiming perfect neutrality.
